VIEWGRID: THE 24/7 ORBITAL WATCHMAN

Turning Space Data into Ground Security

Total Area Awareness through Remote Sensing and Geospatial Intelligence.

In an era of increasing border instability, resource theft, and environmental volatility, physical security is no longer enough. If you are waiting for a sensor to trigger at your perimeter fence, you have already lost the tactical advantage.

The ViewGrid System, part of the JB³Ai The Sentinel Eye suite, provides a continuous, space-based "High Ground" for your operations. By utilizing a constellation of multispectral and radar satellites, ViewGrid transforms the entire earth into a monitored grid. We provide "Ground Truth" that is physically unreachable, monitoring 100% of your territory without a single guard in harm's way.

This isn't just imagery; it is automated intelligence. ViewGrid looks for the invisible signatures of human presence, environmental change, and structural risk, delivering prioritized alerts directly to your command center before a threat ever reaches your gate.

A standard mine perimeter stretches for many kilometers, making traditional patrols reactive. We change that. The JB³Ai Sentinel Eye uses Advanced Satellite Monitoring with SAR and Multispectral sensors to see every hectare of your operation, every hour of the day.

This system analyzes metadata from space. Our algorithms see through clouds and darkness to detect subsidence and surface disturbance with millimeter-level precision. We compare 'Last Week' to 'Today.' If a new footpath is created, a fence is cut, or an informal structure appears, our system flags it immediately.

Example : Our custom 'Plastic Index' identifies illegal mining camp materials from 780km away specifically tuned to the unique 'blue shift' of HDPE tarpaulin used in these camps.

JB³Ai | The Sentinel Eye

Real-time Satellite Monitoring

Continuous orbital surveillance providing 24/7 global coverage and instant situational awareness

AI-Powered Data Analytics

Advanced machine learning algorithms that transform raw data into actionable intelligence

Geospatial Threat Detection

Predictive security mapping that identifies and neutralizes risks before they emerge

The ViewGrid Technology (The Science)

RADAR & MULTISPECTRAL: SEEING THROUGH THE IMPOSSIBLE

ViewGrid operates on a 10m x 10m coordinate system, but its power lies in how it "sees." Standard photography is limited by weather and light; ViewGrid is not.

1. Synthetic Aperture Radar (SAR):

The All-Weather Eye Traditional drones and cameras are blinded by South African summer storms or thick cloud cover. Our SAR sensors emit their own energy pulses that penetrate clouds, smoke, and total darkness. This allows for millimeter-scale detection of Subsidence (ground sinking) and Surface Deformation, revealing underground tunneling or illegal excavation that is invisible to the naked eye.

2. Multispectral Analysis:

The Chemical Fingerprint ViewGrid analyzes 12 distinct bands of light. While the human eye sees a green forest, our sensors see the Spectral Reflectance of materials.

Usecase

- The Plastic Index (PI): Specifically tuned to detect HDPE polymers) often used in illegal camps or temporary storage sites.
- The Bare Soil Index (BSI): Distinguishes between natural winter grass and "fresh" earth disturbance, flagging illegal road construction or new dig sites within 24 hours of the first shovel hitting the ground.

Comparative Analysis (The ViewGrid Advantage)

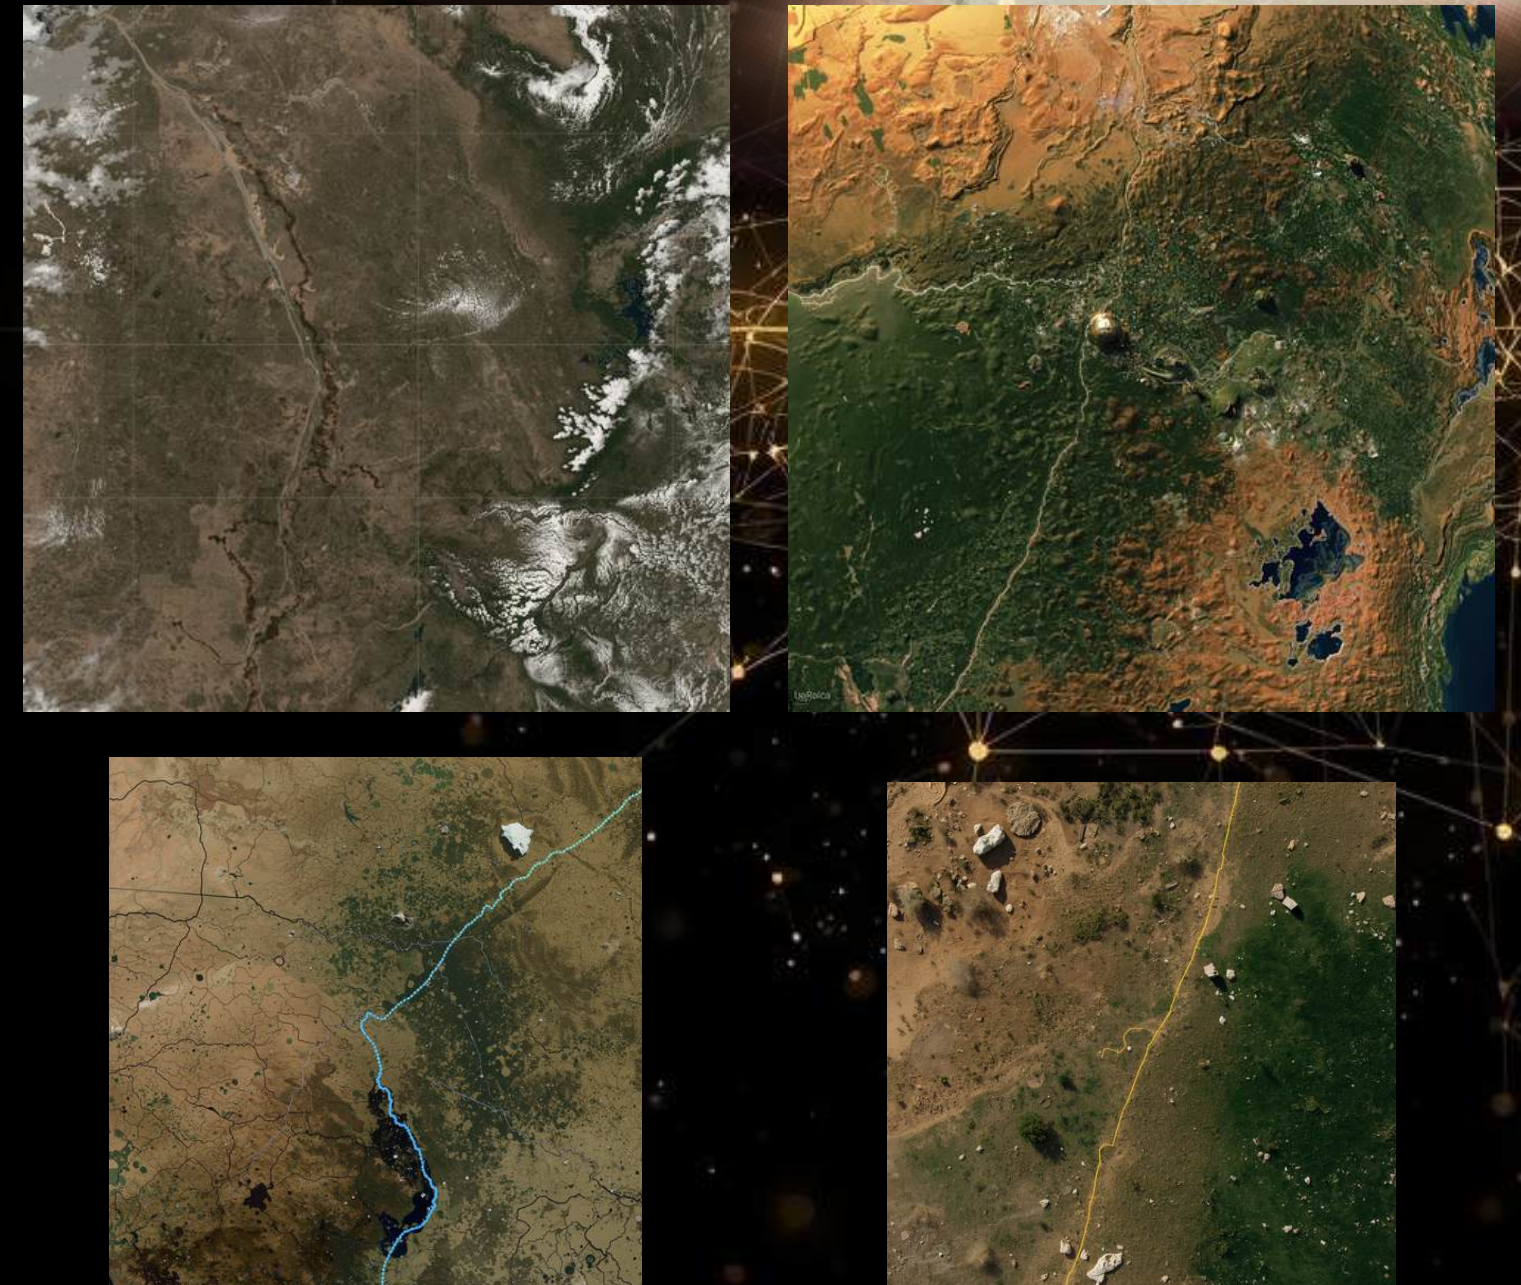

Harnessing the Power of Change Over Time in Security

The most potent asset in a security professional's toolkit is the ability to observe Change over Time. ViewGrid automates this process by maintaining a continuous "Baseline" of your site. Each new satellite pass is automatically compared to the data from the previous week, with our AI identifying instances of "Anomalous Growth" or "Anomalous Decay."

Key Features:

- **Footpath Analysis:**** We monitor the development of "desire lines", small trails through the bushveld that reveal human movement patterns long before a camp is set up.
- ****Infrastructure Integrity:**** We oversee the condition of tailings dams, pipelines, and perimeter roads. By detecting subtle changes in soil moisture or structural elevation, we can predict failures before they escalate into disasters.

This "Digital Time Machine" enables shift commanders to effortlessly switch between two dates, allowing for instant visualization of a syndicate's infiltration window or pinpointing the exact moment when a fence line was breached. It eliminates uncertainty in intelligence, providing a verified, objective timeline of events that can be used in high-stakes reporting.

Cross-Industry Use Cases (The Universal Eye)

BEYOND THE MINE: ADAPTIVE INTELLIGENCE FOR EVERY SECTOR

While built for the rigors of the mining sector, the ViewGrid System is a modular engine designed for any industry requiring large-scale area management.

- 1. Large-Scale Agriculture & Forestry: Monitor thousands of hectares for illegal logging or land invasion. ViewGrid detects unauthorized clearings and monitors crop health through NDVI (Vegetation Index), alerting farmers to irrigation leaks or disease outbreaks before they are visible from the ground.
- 2. Critical Infrastructure & Energy: Protecting power lines and water pipelines across remote terrain is a logistical nightmare. ViewGrid identifies encroachment, vegetation overgrowth near high-voltage lines, and unauthorized vehicles in restricted servitudes.
- 3. Environmental & Government Oversight: Monitor protected parks for poaching activity or track illegal dumping in municipal zones. ViewGrid provides the data necessary for environmental impact assessments and "Blue Economy" coastal monitoring.
- 4. Border & Perimeter Security: ViewGrid serves as a "Virtual Fence," monitoring border zones for new staging areas or temporary shelters, providing national security agencies with the intel needed to deploy assets efficiently.
